

Tableau Server Authentication

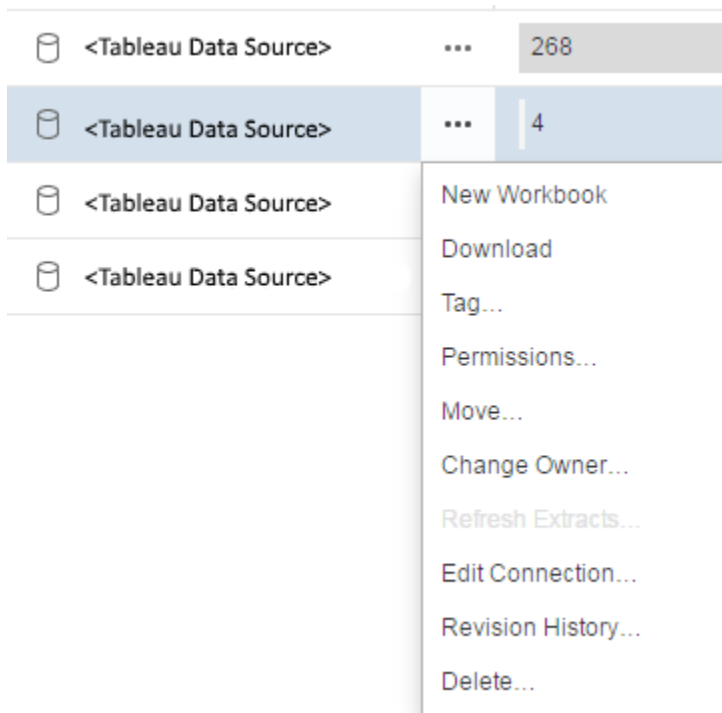

Embedding Passwords

To ensure that views can be seen when embedded in webpages, set the data sources on Tableau Server to have passwords embedded in connection.

1. After a data source has been published, sign-in to tableau server (tableau.mt.gov) and select the project that the data source was published to.
2. Once in the project folder for the correct data source select “Data Sources” tab.

3. From the list of data sources, select the ellipsis next to the correct source and from the menu select “edit connection...”.

4. Select the radio button “Embedded password in connection”. Select “Change the password” and provide the password in the box. Select Test connection to make sure it is successful then select Save.

Edit Connection

Edit the selected data connection.
